

Besides the decrease in greenhouse gas emissions the project contributes to Honduras' sustainable development as follows:

- The project reduces the dependency on fossil fuels, due to the usage of biogas for heat and electricity generation.
- The project proponent has decided to share part of the revenues from this CDM project with the community, by increasing the support given through a corporate social responsibility plan based on education programs for local communities. This is done in cooperation with the National Education Authorities.
- The project involves technology transfer to the region.
- The project will result in environmental benefits: reduced odour and pathogen and vector control.
